- Relative humidity sensor
- Two point calibrated with capacitor type sensor, excellent performance
- Frequency output type, can be easily integrated with user application system
- Very low power consumption
- No extra components needed

**Summary**

The HH10D relative humidity sensor module is comprised with a capacitive type humidity sensor, a CMOS capacitor to frequency converter and an EEPROM used to holding the calibration factors. Due to the characteristics of capacitor type humidity sensor, the system can respond to humidity change very fast. Each sensor is calibrated twice at two different accurate humidity chambers, two unique sensor related coefficients are stored onto the EEPROM on the module. The data is used for humidity calculation.

**Calculation**

In order to read out the correct humidity, 4 calibration factors need to be read out from the EEPROM at address of 10 and 11,12 and 13 for sensitivity, offset.

Once the frequency output from the sensor is measured, then the correct humidity value can be calculated in the following method:

**HH10D Humidity Calculation Algorithm**

Data Definition		eeeprom address
<b>sensitivity</b>	<b>Sens(2byte value)</b>	<b>10</b>
<b>Offset</b>	<b>2 byte value</b>	<b>12</b>
<b>RH(%)=</b>	<b>(offset-Soh)*sens/2^12</b>	

- \* RH(%) linear humidity value
- \* RH\_corr temperature compensated humidity value
- \* Soh is the measured frequency value at Fout port
- the eeeprom physical address is fixed to 01.
